

Title: Photosynthesis

Grade: 8

Photosynthesis is the process by which green plants prepare their own food using sunlight, water, and carbon dioxide. This process mainly occurs in the leaves of plants, where chlorophyll captures sunlight.

The raw materials required for photosynthesis are:

- Sunlight
- Water
- Carbon dioxide
- Chlorophyll

During photosynthesis, plants produce glucose, which is used as food, and oxygen, which is released into the atmosphere.

The chemical equation for photosynthesis is:

Learning Objectives

After completing this lesson, students should be able to:

1. Define photosynthesis.
2. Identify the raw materials required for photosynthesis.
3. Explain the role of chlorophyll.
4. Identify the products of photosynthesis.
5. Describe why photosynthesis is important for life on Earth.

Key Terms

- Photosynthesis
- Chlorophyll
- Sunlight
- Carbon Dioxide

- Water
- Glucose
- Oxygen
